STEREO GRAPHIC EQUALIZER CONSOLETTTE

SANSUI RG-7

RG-7

22

• SPECIFICATIONS

Input sensitivity and impedance (1kHz)

SOURCE IN, TAPE PLAY

..... 150mV/47 kilohms

(Max. input capability; 5V, 20Hz to 20kHz)

MIC 0.8mV/10 kilohms

(Max. input capability; 25mV, 100Hz to 15kHz)

GUITAR 9mV/100 kilohms

Output level (1kHz)

TAPE REC 150mV

PRE AMP OUTPUT 150mV

Total harmonic distortion (1V, 20Hz to 20kHz)

SOURCE IN, TAPE PLAY

..... 0.05%

Frequency response (150mV)

SOURCE IN, TAPE PLAY

..... 20Hz to 20kHz,

+0dB, -0.5dB

Signal to noise ratio (Short-circuit, A-network)

SOURCE IN, TAPE PLAY

..... 70dB

Channel separation (1kHz)

SOURCE IN, TAPE PLAY

..... 60dB

Others

Power voltage 110 ~ 120, 220 ~ 240V
(50/60Hz)

For U.S.A. and Canada

..... 120V (60Hz)

Power consumption ... 16 watts Rated

Dimensions 430mm (16-15/16") W

87mm (3-7/16") H

228mm (9") D

Weight 3.3kg (7.3lbs.) net

3.9kg (8.6lbs.) packed

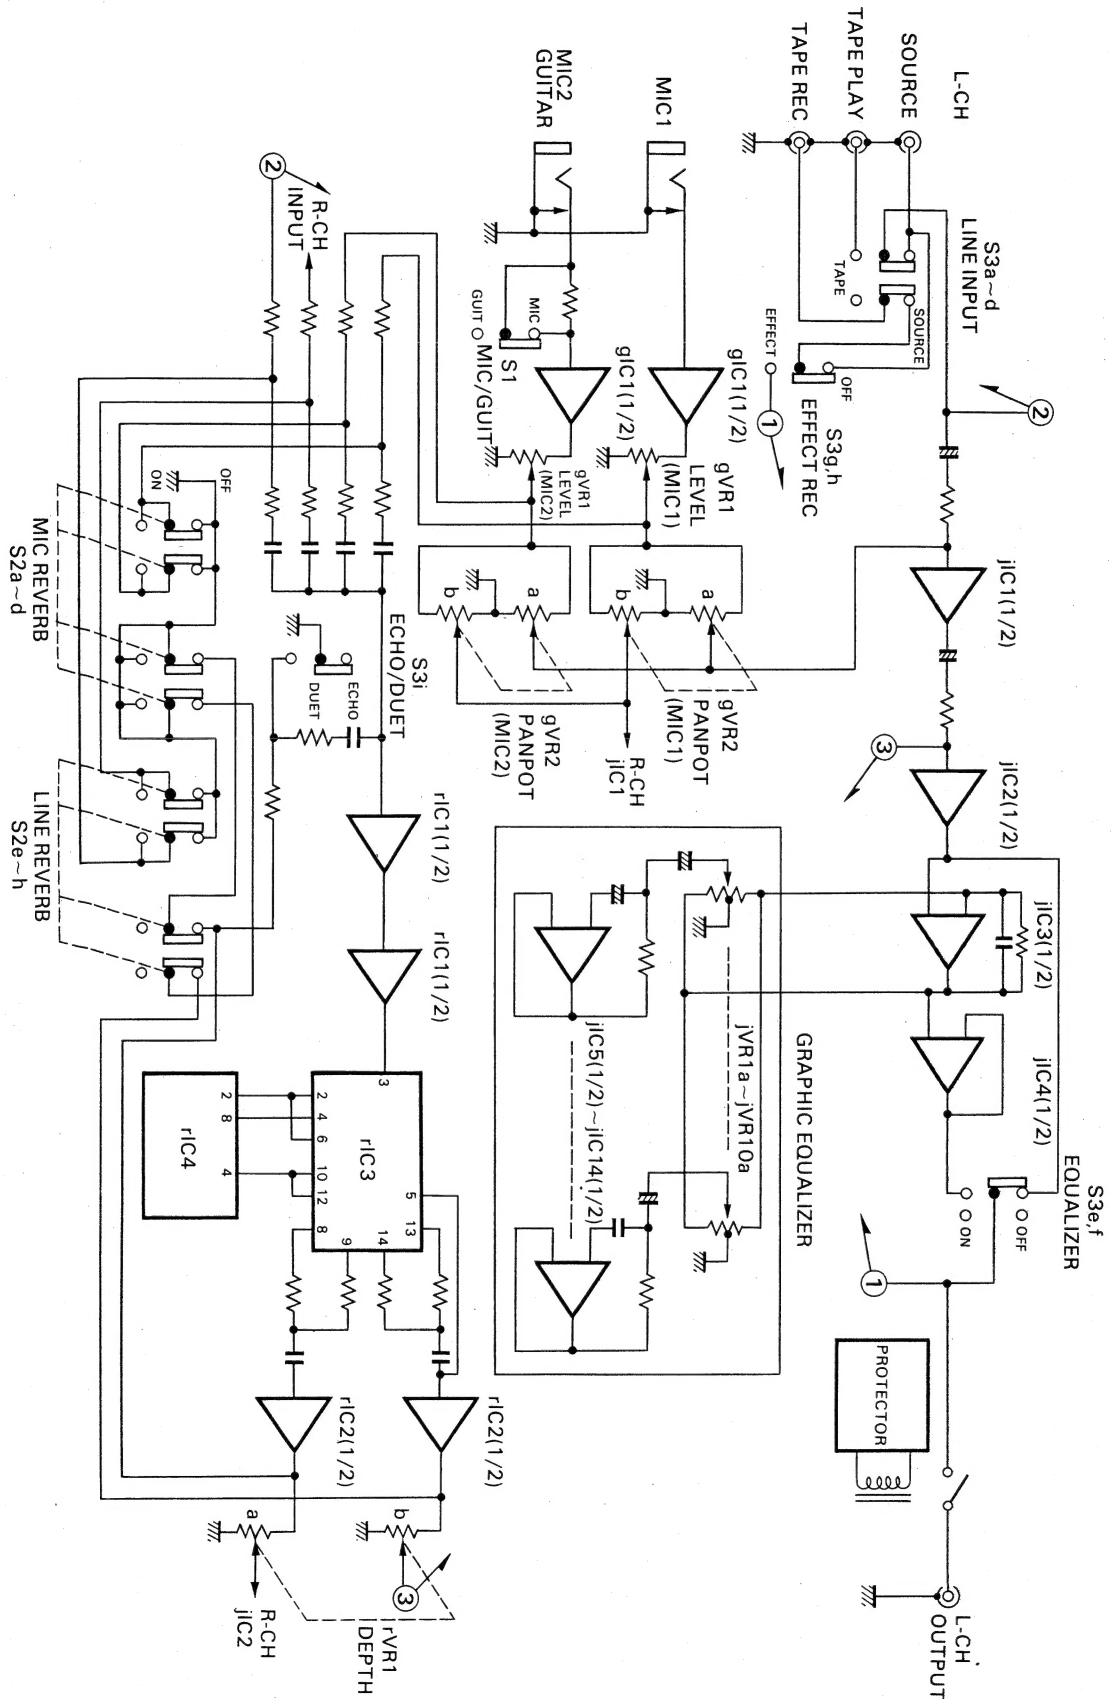

* Design and specifications subject to change
without notice for improvements.

1. BLOCK DIAGRAM

2. OPERATIONS

Model RG-7 is a sound consolette including 10 band graphic equalizer and newly featured electronic reverberation circuit.

Most of sound consolettes have been used a mechanical reverberation unit which utilized mechanical spring in the reverberation circuit. Model RG-7 realizes more natural reverberation effect by use of Bucket Brigade Device (BBD) which gives effective time delay to an audio signal electronically.

2-1. Operation of BBD IC (MN3010)

The BBD IC (MN3010) consists of dual 512-step BBD, and basically, single 512-step BBD has 512 pairs of which each is combined with a transistor and a capacitor. Fig. 2-1 shows the circuit diagram of single 512-step BBD. On this circuit diagram, each transistor works as a switch to transfer electric charge in former capacitor into next. These transistors are controlled by external dual phased clock pulses $\phi 1$ and $\phi 2$, and electric charge corresponding to an audio signal is transferred by turns. After all, similar audio signal with time delay is applied to output terminals. This delay time is determined by both the number of BBD step and the frequency of the clock pulses.

2-2. Operation of BBD Clock Driver IC (MN3101)

To generate the clock pulses $\phi 1$, $\phi 2$ and V_{GG} , and to drive the BBD IC, the BBD Clock Driver IC (MN3101) consists of an oscillator, a flip-flop, a wave-form shaper, a V_{GG} generator and a driver as Fig. 2-2.

The clock pulses $\phi 1$ and $\phi 2$ are reverse phase each other, and both frequencies are determined by externally connected one capacitor and two resistors to OX terminals.

The V_{GG} voltage is regulated to $\frac{14}{15} V_{DD}$ (as GND terminal is in common) in the V_{GG} generator.

2-3. Operation of Reverberation Circuit on RG-7

Each audio signal of MIC, GUITAR and LINE is first amplified by rIC1, and applied to input terminal No. 3 of the BBD IC. Then this signal is delayed in one single 512-step BBD, and outputted from terminals No. 13 and 14. These signals are amplified by rIC2 on left channel after mixed together, and transferred to mix with original left channel audio signal through DEPTH control volume.

In addition, the mixed signal after outputted from the terminals No. 13 and 14, is also applied to input terminal No. 5 of the BBD IC. In the same manner, the signal is delayed again in other one single 512-step BBD, and outputted from terminals No. 8 and 9. These signals are amplified by rIC2 on right channel after mixed together, and transferred to mix with original right channel audio signal through DEPTH control volume.

As the result, comparing to the original input signal, the signal delayed 25mS is outputted to the left channel, and the signal delayed 40mS is outputted to the right channel.

The above expression is the operation when REVERB MODE is set to DUET. When REVERB MODE is set to ECHO, the delayed signal outputted to the right channel is returned to the input of the reverberation circuit again. So that the input signal runs on an echo loop until the signal is decreased to zero. This is the echo effect.

E.C. Electrolytic Capacitor	

• Note: The circuit board, F-3532, F-3524, F-3526, F-3528, F-3529 & F-3530 are not supplied as the assembled. However, the individual parts on the circuit board are provided by orders.

3-5. F-3532 Mic & Reverberation Control Volume Circuit Board
Component Side

Parts No.	Stock No.	Description
gVR1	46097600	Variable Resistor 20kΩ A (Mic Level)
gVR2	46097500	Variable Resistor 250kΩ MN (Panpot)
rVR1	46097700	Variable Resistor 100kΩ x 4 (Reverb Depth)

3-6. F-3524 Low Range Volume Circuit Board

Parts No.	Stock No.	Description
jVR1 ~ 5	46086200	Slide Variable Resistor 250kΩ x 2

3-7. F-3526 High Range Volume Circuit Board

Parts No.	Stock No.	Description
jVR6 ~ 10	46086200	Slide Variable Resistor 250kΩ x 2

3-8. F-3528 Power Switch Circuit Board

Parts No.	Stock No.	Description
pC1	08302200	10000pF 125V C.C.
pS1	46085800	Push Switch (Power)

3-9. F-3529 Reverberation Switch Circuit Board

Parts No.	Stock No.	Description
oS2	46097900	Push Switch (Reverb)

3-10. F-3530 Input Switch Circuit Board

Parts No.	Stock No.	Description
oS3	46098000	Push Switch (Selector)

4. ECHO LEVEL ADJUSTMENT

SETTING: 1) Connect the measurement units as Fig. 4-1.
2) Set the control knobs as follows.

REVERB-MIC OFF
REVERB-MODE ECHO
CH1/CH2 LEVEL Min.
LINE INPUT SOURCE

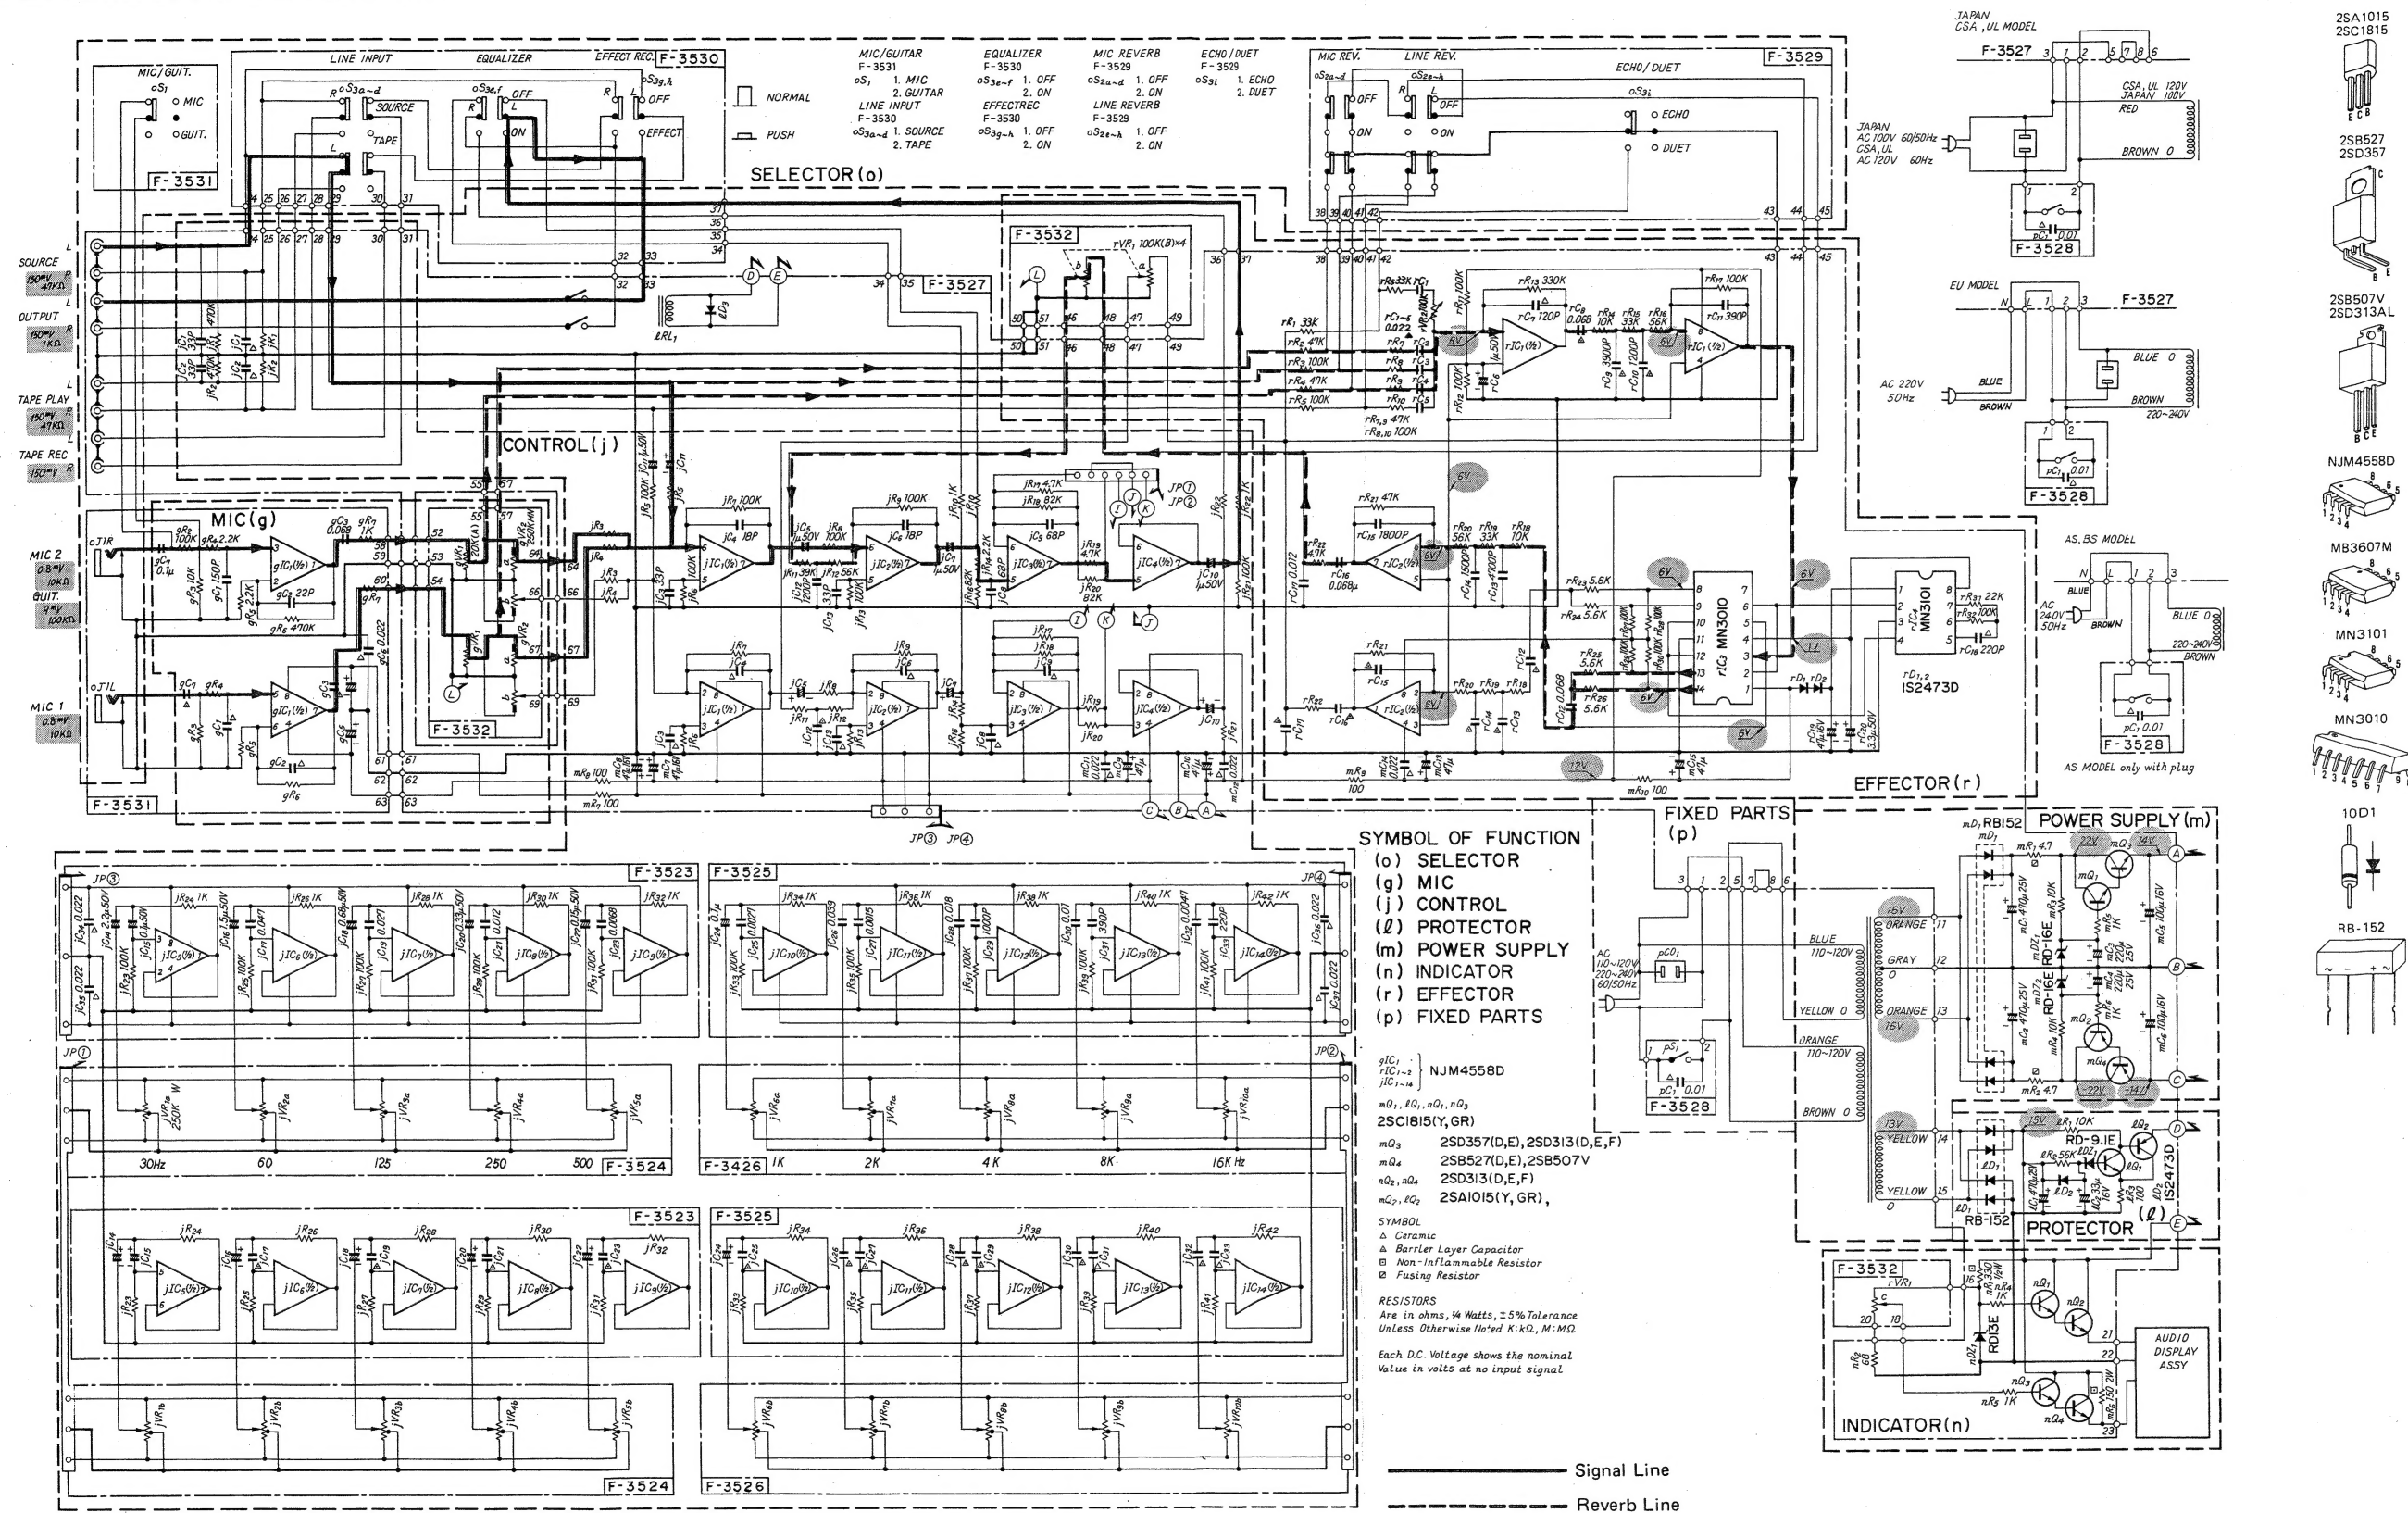

REVERB-LINE ON
REVERB-DEPTH Max.
CH1/CH2 PANPOT Center
EQUALIZER OFF

Fig. 4-1

INPUT SIGNAL	MEASURE OUTPUT	STEP	ADJUSTMENT
800Hz 1.5V SG SOURCE	PREAMP OUT VTVM, Scope	1	Turn the semi-variable resistor rVR2 (F-3527) fully clockwise.
		2	Push LINE INPUT switch to set to TAPE position.
		3	Confirm that the reverberation circuit starts to oscillate, and its wave form comes out from PREAMP OUT.
		4	Turn rVR2 slowly counterclockwise until the oscillation stops.
